

Progress Funding “ Documentation

The purpose of this document is to define the full Progress Funding integration between TeamDesk and Aspire. It includes the user-driven document upload flow, all confirmed API interactions, related workflow actions, and trigger-based automation that continues after users upload Progress Funding documents.

Full Step-by-Step Walkthrough

Progress Funding Request Flow

1. A user opens a [Credit Application](#) record.
2. TeamDesk exposes the **Progress Funding** section only for the roles/users allowed by [Credit Application form behavior](#). The inspected rule shows this section only to [Default Role](#), [PWP](#), [PWP \(Management\)](#), and specific named users.
3. The user uploads [Progress Funding Request Document](#).
4. **Step 1** runs [Progress Funding Document Attached](#), a record change trigger.
5. TeamDesk sends a notification using [Progress Funding Request Email](#).
6. TeamDesk sends the uploaded document to Aspire using [Send To Aspire\(Progress Funding\)](#) with POST /Documents/ProgressFunding/Contract/<Trans#>/transaction.
7. Aspire stores the uploaded Progress Funding request document against the related contract transaction.

Progress Funding Promissory Note Flow

A user opens the same Credit Application record and uploads Progress Funding Promissory Note. Step 2 runs Promissory Note Uploaded, another record change trigger. TeamDesk sends an email using Promissory Note Email Alert. TeamDesk performs Progress Funding UDF Send using POST /udfs/group. Aspire updates the contract UDF group to mark the Progress Funding condition as true. The external contract remains tracked in Aspire as the system of record.

Alternate Flow Name “ Re-upload / Replacement Flow

This flow differs from the primary upload flow because the triggers are configured for **Added**, **Modified** and run when the attachment value changes.

That means:

- replacing the Progress Funding request document reruns the request-document flow
- replacing the promissory note reruns the promissory-note flow
- duplicate email alerts and duplicate outbound API calls are possible

[1. Progress Funding Document Attached](#)

Description: This trigger starts the Progress Funding request-document flow when a request file is uploaded to the Credit Application record.

Why this step exists: Aspire and the internal credit team need the uploaded Progress Funding request document after the user submits it in TeamDesk.

What TeamDesk does: TeamDesk watches the [Progress Funding Request Document](#) attachment column. The trigger runs when:

- the record is **Added** or **Modified**
- [Progress Funding Request Document](#) changes
- the field is not blank

It then runs:

1. [Progress Funding Request Email](#)
2. [Send To Aspire\(Progress Funding\)](#)

Result: The request document is distributed internally and then posted to Aspire.

[2. Progress Funding Request Email](#)

Description: This email alert notifies the credit team that a Progress Funding request document has been uploaded.

Why this step exists: The internal team needs immediate notice that a dealer/PWP-side user submitted a Progress Funding request.

What TeamDesk does: TeamDesk sends an HTML email with:

- **From:** Info@Waterdesk.net
- **To:** credit@purewaterpartners.com, MBrowne@purewaterpartners.com

Subject: [Dealer Name] - Progress Funding Request for Trans [Trans#] - [Company Full Legal Name]

It attaches:

- [Progress Funding Request Document](#)

Result: The credit team receives the uploaded request document and a direct TeamDesk record link.

[3. Send To Aspire\(Progress Funding\)](#)

Description: This Call URL action sends the Progress Funding request document from TeamDesk to Aspire.

Why this step exists: The uploaded request document must be associated with the correct Aspire contract transaction.

What TeamDesk does: TeamDesk performs a POST request using the configured authorization account [Used for the Credit Application](#). The target URL uses:

- [Aspire Http Link](#)
- [Trans#](#), converted to text and trimmed before the decimal

The request body is sent as: asdf=<[%[Progress Funding Request Document] %>

The action notes indicate:

| document type is currently coming through as "Unknown"

Result: Aspire receives the Progress Funding request document for the related transaction. The inspected action log shows successful 200 responses and at least one prior 500 response, confirming both active usage and occasional integration failure handling.

Syntax	Description
Method	POST
Url	https://<[%[Aspire Http Link] %>.leaseteam.net/LeaseTeam.Aspire.Api/1/Documents/ProgressFunding/Contract/<%Left(ToText([Trans#]),".") %>/transaction
Headers	Content-Type: application/json
Body	see JSON below
<pre>{ "rawBody": "asdf=<[%[Progress Funding Request Document] %>" }</pre>	

[4. Promissory Note Uploaded](#)

Description: This trigger starts the promissory-note side of the Progress Funding process after a promissory note file is uploaded.

Why this step exists: The promissory note upload must notify internal users and update Aspire so the contract reflects the funding milestone.

What TeamDesk does: TeamDesk watches the [Progress Funding Promissory Note](#) attachment column. The trigger runs when:

- the record is **Added** or **Modified**
- [Progress Funding Promissory Note](#) changes
- the field is not blank

It then runs:

1. [Promissory Note Email Alert](#)
2. [Progress Funding UDF Send](#)

Result: The uploaded promissory note causes both an internal alert and an Aspire contract update.

[5. Promissory Note Email Alert](#)

Description: This email alert notifies internal credit/funding recipients that a promissory note has been uploaded.

Why this step exists: The funding team needs the promissory note immediately after it is submitted in TeamDesk.

What TeamDesk does: TeamDesk sends an HTML email with:

- **From:** Info@Waterdesk.net
- **To:** Jackie@purewaterpartners.com, MBrowne@purewaterpartners.com
- **Cc:** Kyle Lawson, Marie Thompson, Me, Credit@purewaterpartners.com

Subject:

Progress Funding: Promissory Note submitted for [Trans#] - [Company Full Legal Name] - [Dealer Name]

It attaches:

- [Progress Funding Promissory Note](#)

Result: The funding/credit team receives the promissory note and a direct link to the TeamDesk record.

6. Progress Funding UDF Send

Description: This Call URL action updates an Aspire contract UDF group when the promissory note is uploaded.

Why this step exists: Aspire is the system of record, so TeamDesk needs to signal that the Progress Funding promissory note milestone has been reached.

What TeamDesk does: TeamDesk performs a POST request to Aspire using the configured authorization account [Used for the Credit Application](#).

The body:

- identifies the object type as Contract
- sets a UDF field value to True
- targets UDF record CON_30
- targets the contract using [Contract#](#)

Result: Aspire updates the contract UDF group to mark the contract as having reached the Progress Funding milestone represented by CON_30.

Syntax	Description
Method	POST
Url	https://<[Aspire Http Link]>.leaseteam.net/LeaseTeam.Aspire.API/1/udfs/group
Headers	None
Body	see JSON below
<pre>{ "Type": "Contract", "Fields": [{ "Value": "True", "ValueType": "Text", "RecordId": { "Value": "CON_30", "Type": "Record" } }], "RecordId": { "Value": "<[Contract#]>", "Type": "Record" } }</pre>	

Record Change & Periodic Triggers

The Progress Funding process does not end after submission. TeamDesk continues synchronization using triggers.

These triggers support:

- status synchronization
- payment or term updates
- post-submission structural changes such as billing-location updates

The inspected database does **not** show a dedicated periodic trigger specifically for Progress Funding only. However, the Credit Application record continues to participate in broader post-submission sync logic.

7. Update ContractStatus From Aspire

Purpose: This periodic trigger keeps TeamDesk's contract status aligned with Aspire after submission.

When it runs:

- **Type:** Periodic
- **Schedule/Condition:** periodic nightly sync; the trigger note says it runs when ContractStatus is not booked and uses recent modified data

Which records it checks: From prior inspection and current trigger set:

- [ContractStatus](#) is not Booked
- recently modified / in recent period
- records where Aspire may have newer status information

What fires the trigger: This is a periodic trigger, so it is schedule-driven rather than field-change-driven.

What TeamDesk does:

1. Selects qualifying Credit Application records
2. Calls Aspire for updated contract status data
3. Writes refreshed status back into TeamDesk fields

Why this matters: Progress Funding records still live on Credit Application records. Any later Aspire contract status changes must continue to flow back into TeamDesk.

Result: TeamDesk remains synchronized to Aspire's contract status state after the initial Progress Funding uploads.

8. [Term Change\(Equipment Asset Only\)](#)

Purpose: This trigger recalculates and resends payment information after term or billing changes on submitted applications.

When it runs:

- **Type:** Record Change
- **Schedule/Condition:** when matching submitted equipment-only applications are modified

Which records it checks:

- submitted equipment-only credit applications
- triggered by term/frequency-related changes

What fires the trigger: Changes in:

- [Billing Freq\(New\)](#)
- billing frequency fields
- [Term\(New\)](#)

What TeamDesk does:

1. Removes old rate sheet data
2. Re-queries rates
3. Rebuilds funding values
4. Re-sends payment information to Aspire
5. Continues related term-change logic

Why this matters: If Progress Funding happens on a Credit Application whose financial terms later change, the broader contract data in Aspire remains synchronized.

Result: Aspire contract payment information is refreshed after qualifying term/frequency changes.

9. [Create Billing Location](#)

Purpose: This trigger creates and applies a separate billing location in Aspire after submission or approval.

When it runs:

- **Type:** Record Change
- **Schedule/Condition:** when qualifying billing-address fields change after submission/approval

Which records it checks:

- [Bulk Load Units](#) = No
- [Use Customer Address](#) = false
- [ContractStatus](#) is in approved/submitted states

What fires the trigger: Changes in billing address fields such as:

- [B-Street 1](#)
- [B-City](#)
- [Use Customer Address](#)

What TeamDesk does:

1. Creates a bill-to location in Aspire
2. Updates the Aspire contract to use it
3. Refreshes payment stream information
4. Updates related attached-unit bill-to values

Why this matters: Progress Funding records still belong to the same contract lifecycle, so later billing structure changes must stay aligned in Aspire.

Result: Aspire contract and billing-location structure remain accurate after post-submission billing changes.

Appendix

Example Scenario 1 – Request Document Upload

1. PWP user opens a Credit Application record.
2. User uploads [Progress Funding Request Document](#).
3. [Progress Funding Document Attached](#) runs.
4. TeamDesk emails the credit team.

5. TeamDesk posts the file to Aspire™'s Documents/ProgressFunding/Contract/<Trans#>/transaction endpoint.

Example Scenario 2 – Promissory Note Upload

1. User uploads [Progress Funding Promissory Note](#).
2. [Promissory Note Uploaded](#) runs.
3. TeamDesk emails internal recipients with the file attached.
4. TeamDesk posts a UDF update to Aspire using [Progress Funding UDF Send](#).
