

Full New Dealer Setup “ Documentation

Purpose

The purpose of this document is to define the current TeamDesk process for **new dealer setup** across the relevant databases and integrations.

This process includes:

- dealer creation in the **PWP Customer Service Portal**
- Opportunity submission and update from the **Dealer WaterDesk Opportunity database**
- zip-, market-, location-, and office-based routing dependencies
- work-order routing dependencies
- downstream TeamDesk integration dependencies

This document includes confirmed live setup findings and clearly identifies items that remain pending confirmation before the SOP can be considered fully complete.

Steps

Full Step-by-Step Walkthrough

Primary Flow

1. A user initiates dealer creation in the **PWP Customer Service Portal** using [Create New Dealer](#).
2. TeamDesk assigns the source Accountâ€™s [Trans #] into [Dealer Id].
3. TeamDesk runs [Create New Dealer Record](#) to create the Dealer record.
4. TeamDesk runs [Dealer Record Created](#) to mark the source Account as already processed.
5. In the **Dealer WaterDesk Opportunity database**, a user submits or updates an Opportunity using one of the PWP submission buttons.
6. TeamDesk executes a **Call URL** action to the PWP Customer Service Portal REST endpoint:

POST https://waterdesk.teamdesk.net/secure/api/v2/76449/Credit Application/upsert.json
7. On create paths, TeamDesk stores returned identifiers back onto the Opportunity:
 - Aspire CS Portal ID
 - Aspire CS Portal Record ID
8. Operational routing then depends on the confirmed live structure around:
 - Companies
 - Zip Codes
 - Locations
 - Offices
 - Work Orders
 - downstream Omniflow integration

Alternate Flow Name

There are three submission variants in the current setup:

- **Standard create path**
- **Midterm Upgrade create path**
- **Update path**

There are also backend continuations involving routing and integrations that depend on:

- zip-driven routing
 - office/location routing
 - work-order routing
 - Omniflow service-ticket creation
 - possible downstream Credit Application automations
-

1. [Create New Dealer](#)

Description:

This is the dealer-creation entry point in the **PWP Customer Service Portal**.

Why this step exists:

It starts dealer creation from the source Account.

What TeamDesk does:

This custom button is available when:

- [Role] is Dealer
- [Dealer Record Created] is not checked

It:

- assigns [Trans #] â†’ [Dealer Id]
- runs [Create New Dealer Record](#)
- runs [Dealer Record Created](#)

Result:

A Dealer record is created and the source Account is marked as processed.

2. [Create New Dealer Record](#)

Description:

This is the **Create Record** workflow action used during dealer creation in the **PWP Customer Service Portal**.

Why this step exists:

It creates the Dealer record from Account data.

What TeamDesk does:

It creates a record in the [Dealer table](#) with confirmed assignments including:

- [Name] â†’ Dealer Name
- [Name] â†’ Parent Company
- true â†’ Head Office
- [Dealer Id] â†’ Dealer No
- [AccountId] â†’ Dealer Account ID
- address, city, state, postal code
- phone and email
- "Active" â†’ Account Status
- Today() â†’ Account Status Date
- "Business" â†’ Business or Individual

Result:

A new Dealer record exists in the PWP Customer Service Portal.

3. [Dealer Record Created](#)

Description:

This is the **Update Record** workflow action that completes the immediate dealer-creation sequence.

Why this step exists:

It prevents duplicate dealer creation from the same Account.

What TeamDesk does:

It updates the source Account:

- Dealer Record Created = true

Result:

The source Account is marked as already processed.

4. Company / Zip / Market / Location Routing Structure

Description:

The live routing structure for dealer operations is built around **Companies**, **Zip Codes**, **Locations**, and **Offices**.

Why this step exists:

Dealer rollout depends on routing by market, service market, territory, office, and location.

What TeamDesk does:

Confirmed live setup shows:

Companies

- Zip Code references **Zip Codes**
- Account Market is looked up from zip Market

Zip Codes

Contains routing fields including:

- Market
- Service Market
- Service/Sales Market
- Dealer
- Dealer Number
- Sales Rep
- Primary Tech
- Zip Territory
- Territory By Zip
- Sub Territory By Zip
- Multi-Territory

Locations

- Zip Code references **Zip Codes**
- market and territory values are looked up from zip
- Market Form uses Market Override if present, otherwise Market

Offices

- reference **Locations**
- inherit market and location-derived data from the linked location

Result:
Routing is zip- and location-driven.

5. Dealer Hierarchy / Parent Company / Head Office Model

Description:
The live structure is company-centered and location-centered, but a complete parent/head-office/branch model is not fully established from the inspected setup.

Why this step exists:
A complete new dealer SOP needs to know whether a dealer must be linked to a parent company or branch structure.

What TeamDesk does:
Confirmed setup shows:

- the live structure is centered on **Companies** and **Locations**
- a company has many locations
- Referral Company is a self-reference on Companies
- Billing Location and Primary Billing exist on Locations

Result:
Company-to-location structure is confirmed. A true parent/head-office/branch model remains pending confirmation.

6. Send To PWP CS Portal

Description:
This is the standard Opportunity create-path button in the **Dealer WaterDesk Opportunity database**.

Why this step exists:
It submits a new Credit Application to the PWP Customer Service Portal.

What TeamDesk does:
Confirmed visibility:

- Admin
- Admin 2
- Default Role

Confirmed filter:

- Aspire CS Portal ID is blank
- Term >= 24

It runs:

- Send New To Aspire CS Portal Redux

Result:

A standard create/upsert submission is initiated.

7. Send New To Aspire CS Portal Redux

Description:

This is the standard **Call URL** action for Opportunity submission.

Why this step exists:

It sends Opportunity data into the PWP Customer Service Portal Credit Application endpoint and stores returned identifiers.

What TeamDesk does:

Confirmed setup:

- **Authorization:** Admin Auth
- **Method:** POST
- **URL:** https://waterdesk.teamdesk.net/secure/api/v2/76449/Credit Application/upsert.json
- **Execute Triggers:** No

Confirmed payload includes:

- company legal name
- shipping address fields
- term
- billing frequency
- total units
- total monthly payment
- source app/opportunity IDs
- Administrator Id = 600
- market-based Case([Market], ...) mappings for:
 - Dealer No
 - Select the Distributor
 - Dealer Name
- source record IDs
- company phone and email
- DBKEY

Confirmed response assignments:

- \${0}.key â†’ Aspire CS Portal ID
- \${0}.id â†’ Aspire CS Portal Record ID

Result:

A Credit Application is created/upserted in the PWP Customer Service Portal and response IDs are stored on the Opportunity.

API Details

Syntax

Description

Method POST

Url https://waterdesk.teamdesk.net/secure/api/v2/76449/Credit Application/upsert.json

Headers Content-Type: text/json

Body see JSON below

```
{
  "Company Full Legal Name": "<[Company Name]>",
  "New Main Address": "<[Shipping Address Line 1]>",
  "New Main Address#2": "<[Shipping Address Line 2]>",
  "New City": "<[Shipping City]>",
  "New State": "<Upper([Shipping State])>",
  "New Zip/Postal Code": "<[Shipping Zip]>",
  "Term(New)": "<Left(ToText([Term]),'.')>",
  "Billing Freq(New)": "<[Billing Freq]>",
  "Total Number of Units": "<ToText([Total Qty])>",
```

```
"Total Monthly Payment Amount": "<%=ToText([Total TMP])%>",
"Waterdesk ID": "<%=AppId()%>",
"Waterdesk Opp Id": "<%=Id]%>",
"Administrator Id": "600",
"Dealer No": "<%=Case([Market], ...) %>",
"Select the Distributor": "<%=Case([Market], ...) %>",
"Dealer Name": "<%=Case([Market], ...) %>",
"Opportunity Record ID": "<%=RecordId()%>",
"Company Record ID": "<%=Company Record ID]%>",
"Location Record ID": "<%=Location Record ID]%>",
"AS1-Phone": "<%=Company Phone]%>",
"New Email": "<%=Company Email]%>",
"DBKEY#": "<%=Var[DBKEY]%>"
}
```

8. MTU and Update Paths

Description:

The process includes both Midterm Upgrade and update variants in addition to the standard create path.

Why this step exists:

The process supports both MTU submissions and updates to existing Credit Applications.

What TeamDesk does:

Confirmed to exist:

- Send to PWP CS Portal(MTU)
- Send New to Credit App MTU
- Send Update to PWP CS Portal
- Send Update To CA Redux

Earlier confirmed inspection established:

- MTU uses a different payload
- update path includes Id from Aspire CS Portal ID
- both call the same PWP Customer Service Portal endpoint

Result:

MTU and update paths are part of the process. Detailed reconfirmation of their latest button filters, payloads, and visibility remains pending.

9. Work Order Routing

Description:

Work Order routing is a backend operational dependency for new dealer rollout.

Why this step exists:

Dealer rollout is incomplete if service, install, swap, and pickup work orders do not route correctly.

What TeamDesk does:

Confirmed active routing-related triggers include:

- Notify Tech
- Tech Not Assigned
- Service Swap Update
- Sales Swap Update
- Pickup Eq Update
- New Sales Rep Install Request
- multiple hourly Tech Grab triggers

Confirmed note on several triggers:

- when a new office is spun up, a **Location ID must be added to a Case statement**

Confirmed routing structure:

- Locations relate to Work Orders
- Offices relate to Work Orders by market and office relation

Result:

Work-order routing depends on market/office/location structure and contains hardcoded maintenance points that may require updates for a new office/dealer rollout.

10. Shared DB / Omniflow Dependency

Description:

A downstream TeamDesk-to-TeamDesk integration is active for Omniflow-related service work.

Why this step exists:

Dealer rollout may fail operationally even when local setup is correct if downstream service-ticket integration is not aligned.

What TeamDesk does:

Confirmed trigger:

- New Omniflow Service Ticket

Confirmed matching:

- Service Type = Field Service or Shop Repair
- Equipment Model = M6, S1, or S3

Confirmed linked action:

- Send To Omniflow

Confirmed action settings:

- uses Admin Auth
- POST https://waterdesk.teamdesk.net/secure/api/v2/91748/Service Ticket/upsert.json?match=Service Call Id

Confirmed payload includes:

- Work Order Id â†’ Service Call Id
- Equipment Serial â†’ Serial Number
- Sub Type
- Technician Notes
- Model

Result:

A live dependency to TeamDesk database 91748 is confirmed.

API Details

Syntax	Description
Method POST	
Url https://waterdesk.teamdesk.net/secure/api/v2/91748/Service Ticket/upsert.json?match=Service Call Id	
Headers Authorization via Admin Auth	
Body see JSON below	
<pre>{ "Service Call Id": "<[Work Order Id]>", "Serial Number": "<[Equipment Serial]>", "Sub Type": "<[Sub Type]>", "Technician Notes": "<[Technician Notes]>", "Model": "<[Model]>" }</pre>	

11. User / Access / Role Visibility

Description:

Role and record-access restrictions are part of successful dealer rollout.

Why this step exists:

Users must be able to see required records and use required buttons for the process to work outside admin testing.

What TeamDesk does:

Confirmed live roles include:

- Admin
- Admin 2
- Owner
- Account Executive
- BDR
- Sales Manager
- Service Manager
- Service Tech

- additional read-only / hybrid / special-purpose roles

Confirmed record access pages were inspected for:

- **Companies**
- **Opportunities**

Confirmed schema-level user associations include:

- company sales/major account rep links
- zip sales rep / primary tech links
- office regional manager links

Confirmed button restriction:

- Send To PWP CS Portal is limited to Admin, Admin 2, and Default Role

Result:

Access is a confirmed dependency. Full per-view, per-dashboard, and UI-level visibility remains pending confirmation.

Record Change & Periodic Triggers

The process includes backend trigger dependencies, especially in **Work Orders**.

Work-order routing triggers

Purpose:

Maintain dispatch, assignment, swap, pickup, and service routing.

When it runs:

Record-change and periodic triggers are both present in the Work Orders area.

Schedule/Condition:

Multiple active hourly/periodic triggers exist, along with several active record-change routing triggers.

Which records it checks:

Work Orders and related office/location/work-order relationships.

What fires the trigger:

Various service/install/swap/pickup conditions. Not every individual routing trigger page was inspected in full detail.

What TeamDesk does:

- routes work-order activity
- performs tech assignment and notification logic
- relies in part on office/location case-statement maintenance

Why this matters:

New dealer rollout is not operationally complete if these routes are not aligned.

Result:

Routing dependencies are confirmed. Full trigger-by-trigger logic remains pending confirmation.

New Omniflow Service Ticket

Purpose:

Push eligible Work Orders into another TeamDesk Service Ticket table.

When it runs:

Type: Record Change

Schedule/Condition:

Confirmed when:

- Service Type = Field Service or Shop Repair
- Equipment Model = M6, S1, or S3

Which records it checks:

Work Orders

What fires the trigger:

Matching Work Orders for eligible service types and models

What TeamDesk does:

Runs Send To Omniflow and upserts into DB 91748.

Why this matters:

This is a live downstream operational dependency.

Result:

Eligible Work Orders generate or update external TeamDesk service tickets.
